

Solution scenarios of the DNmark project

Aim:

- Explore mitigation tools; effects on N fluxes, nationally and locally
- Scenarios central part of the work in DNmark
- All RC involved in scenario-building

arios of the DNMARK project

mitigation tools and their effects on N fluxes, na
ntral part of the work in DNmark
ved in scenario-building

Inputs to scenarios; drivers behind changes:

- Global and national drivers lead to changes in nitrogen cycling in Denmark
- Effects on land use and management
- Effects on changes in internal and external cycling (and losses) of nitrogen in farming (and societal) systems

Drivers:

- i. Changes in demand for biomass products (food, feed, fiber and bioenergy)

Drivers:

ii. Changes in technology, in particular within agricultural land use and management

Drivers:

- iii. Changes in priority of land for other ecosystem services

Drivers:

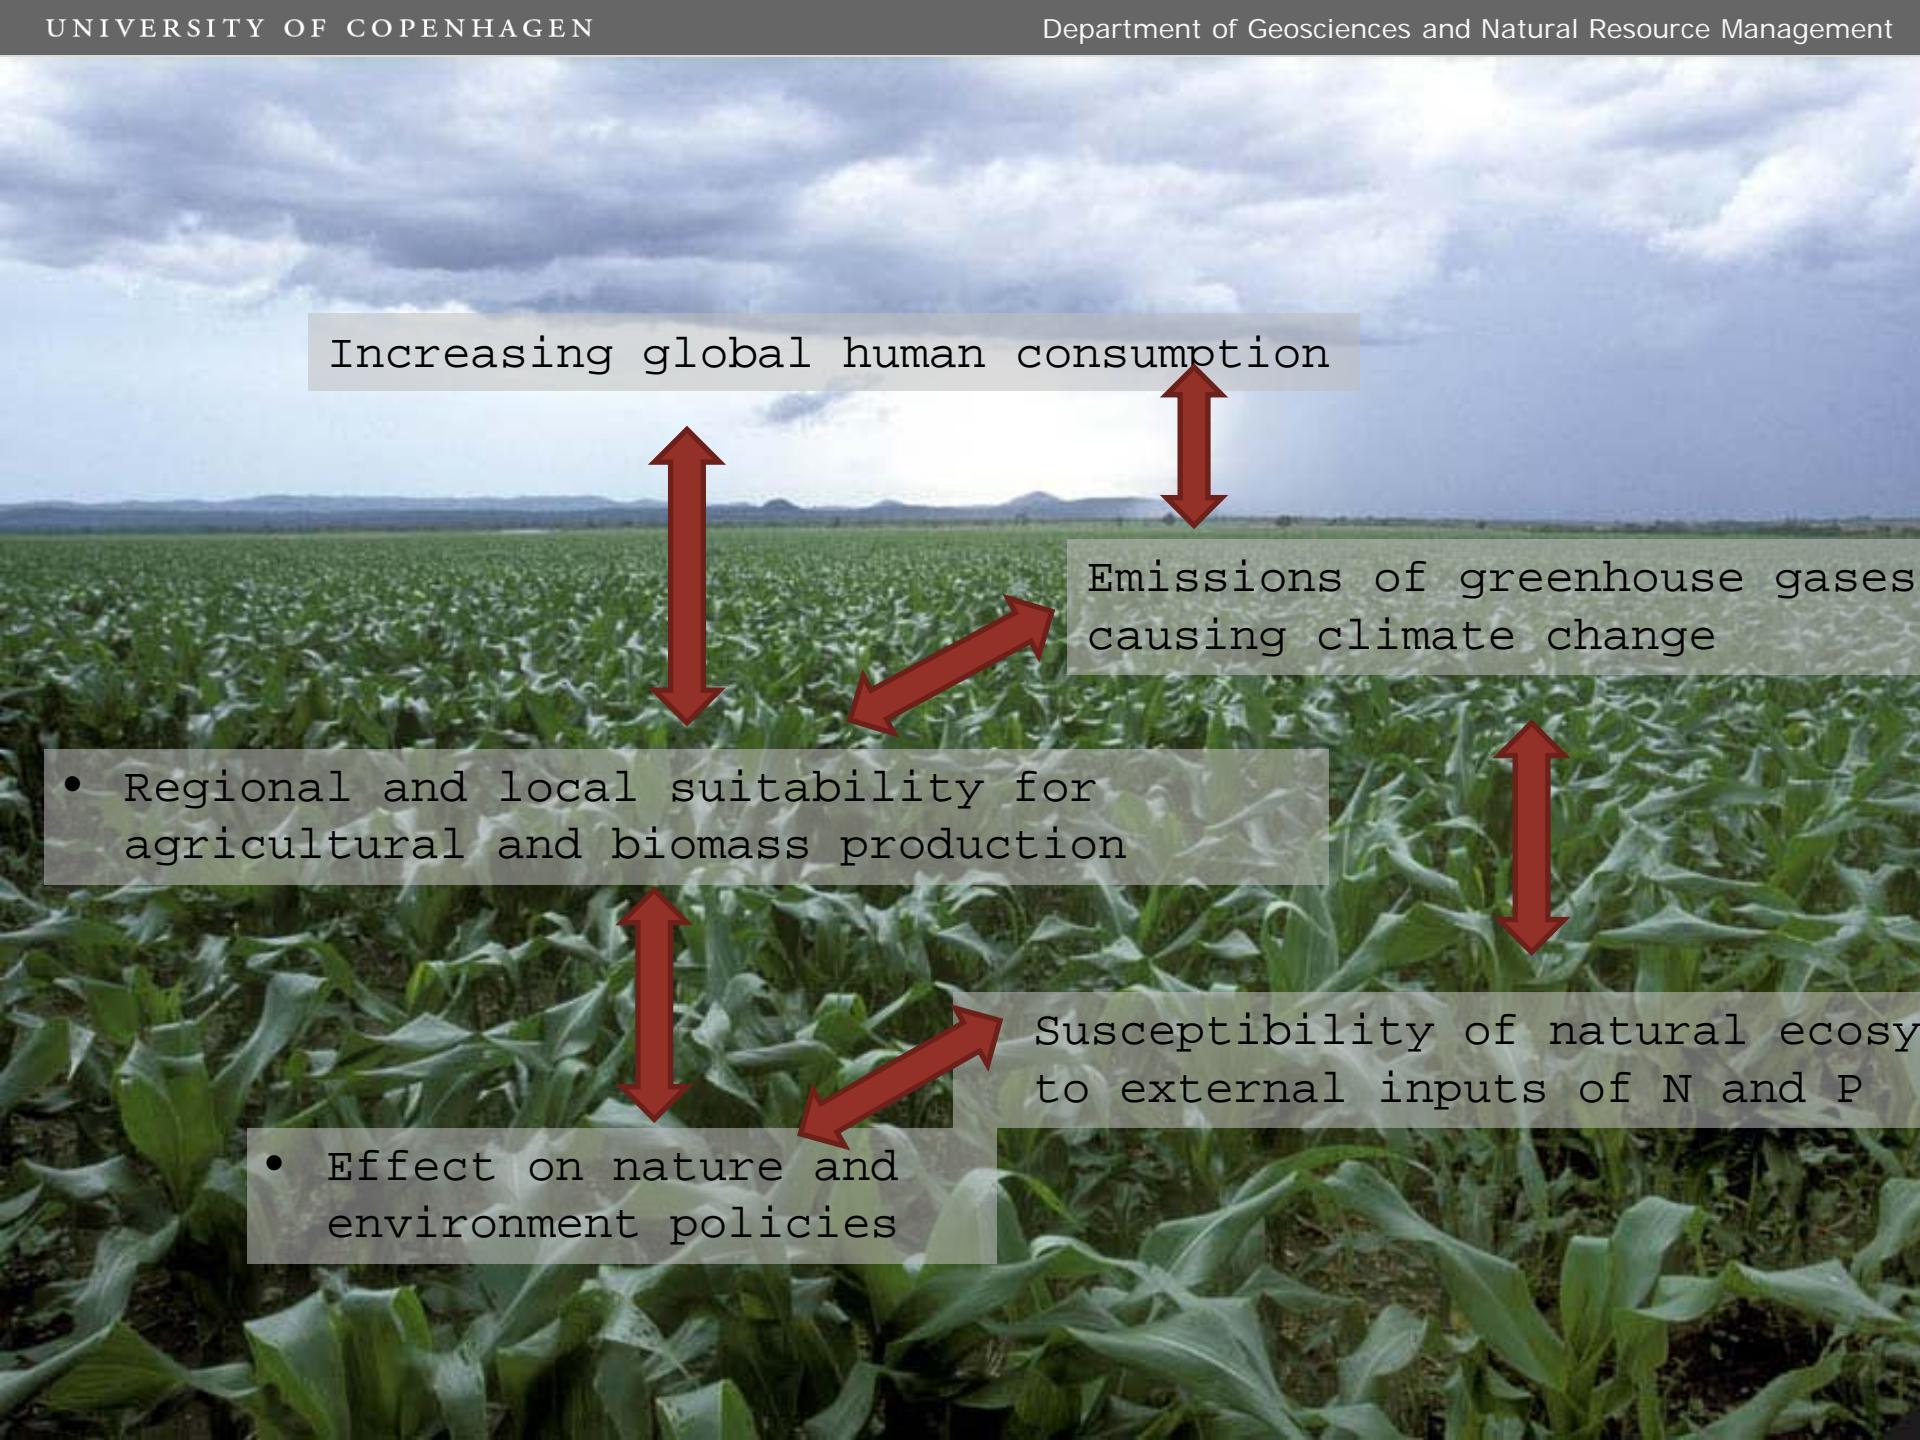

- iv. Changes in environmental conditions (including climate change)

Into the future - inputs to scenarios:

Drivers are interacting - how and how much, and with which consequences?.

Increasing global human consumption

Emissions of greenhouse gases causing climate change

- Regional and local suitability for agricultural and biomass production

- Effect on nature and environment policies

Susceptibility of natural ecosystems to external inputs of N and P

D N

science and action
